Feedback: Utilizing Custom GPTs with Python

5 messages

Sourceduty <sourceduty@gmail.com> Fri, Oct 4, 2024 at 7:35 PM

Currently, there is no direct way to access custom GPTs through the OpenAI Python API. This limitation prevents developers from fully utilizing the specific configurations, enhancements, or domain-specific knowledge embedded in custom GPTs when building Python-based applications. While these custom models can be interacted with through the web interface, the absence of API access restricts their use in automation or integration with broader systems that rely heavily on Python for tasks such as real-time data analysis, content generation, or custom workflows. Without this programmatic access, developers miss out on leveraging these tailored models for continuous or large-scale operations that require smooth, API-driven interactions.

This limitation is especially notable for those aiming to embed custom GPTs into automated pipelines or integrate them into more complex applications that require dynamic, real-time responses. For instance, a developer might want to deploy a custom GPT in a customer service chatbot, content moderation system, or personalized recommendation engine, where responses are required to be both specific and instantaneous. Since this is not feasible through the API at present, developers would either need to manually interact with the custom GPT via the web or attempt to replicate its behavior using standard GPT models available through the API. This workaround, however, adds complexity and doesn't fully capture the precise customizations of the original model, underscoring a key gap in functionality that could potentially be addressed in future updates to the API.

Hi there,

Thank you for sharing your feedback on the current limitations regarding the access to custom GPTs through the OpenAI Python API. We understand how important it is for developers to fully leverage the capabilities of custom GPTs within Python-based applications, especially for automation, integration with broader systems, and for implementing real-time, dynamic responses in various applications such as chatbots, content moderation systems, or personalized recommendation engines.

Your insights highlight a significant opportunity for us to enhance our API offerings to better support developers' needs for more seamless, API-driven interactions with custom GPTs. We're always looking for ways to improve our products and services, and feedback like yours is invaluable in guiding our development priorities.

While I can't provide a specific timeline or details on future updates at this moment, please know that we take your feedback seriously. Our product team is continuously working on expanding the functionalities of our API to address the evolving needs of our users. We encourage you to keep an eye on our release notes and announcements for any updates related to this functionality.

In the meantime, if you have any more feedback, questions, or specific use cases you'd like to discuss further, please don't hesitate to reach out. Your input is crucial in helping us build better tools for the developer community.

Best,
OpenAI Team

OpenAI
